

Large-Scale Model-Based Certification Interface

From shard adapters and vote vectors to count-based baselines and shard-aware row-column MILPs

Interface	Input information	Stability question	Validity question	Main limitation
Final-output	tool counts	preserve tool class	block observed tool target	ignores token/shard structure
Token grid	$X[i,l,k]$	protect any retained token	force all active target tokens	requires rectangular H horizon

Use as a setup figure near Section 5.4 or before the large-scale results. Replace example labels/counts with exact run metadata if needed.
